ABSTRACT

This is a study of effective golf course maintenance; the focus is on the golf course condition.

The job of a ‘green keeper’, currently known as ‘golf course superintendent’, is not as simple as it seems to be. Living under the threat of unforeseeable weather conditions, undetectable pest living in the soil, and all other factor, which will in turn affect the turf condition, a golf course superintendent is voted to be one of the jobs faced with greatest pressures.

Good turf condition is subjective by nature due to different expectation from different people. Some are easily satisfied, while some are not.

This study aims to find out the problems that are faced by turf managers and the remedies. And it can be seen that for the turf of any course to be at its best condition, it requires much knowledge and experience from the golf course superintendent to be in the particular course in order to cure any problem effectively.
