ABSTRACT

The area of research dwells on aesthetics as one of the main factors that affect a person's senses as he uses an urban space. By assessing the qualities of a townscape, one is made aware of the potential inherent in the environment that can be exploited to advantage. The study here focuses on the pedestrian domain of Boat Quay, Singapore. It will analyze the aesthetic qualities of the area, which will be subsequently used to develop a set of guidelines to create walkable spaces in the specific context of Singapore.
